E Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TWF) super family and induces B cell through and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lugus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABPA3990-ABPA122B represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          130 GlySerGlyGlyGlyGlySerGlyGlyGlyGlySerAspIleValMetThrGlnSerPro 149

This invention relates to novel antibodies that immunospecifically Dand chromosome 13934 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scPvs) derived, preferably, from the variable chain antibody molecules (scPvs) derived, preferably, from the variable chary fragment thereof, of either human, murine, rat or monkey BLyS. The present invention refers to the use of such antibodies in various methods present invention, or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders such, these compositions are useful for identifying immune disorders including mysthemia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as ADS and proliferative disorders including leukaemia, carcinoma and cativities such as antirheumatic, antialthritic, neuroprotective, antialthammatory, antiasthmatic, antialthritic, neuroprotective, antiantiammatory, antiasthmatic, antialthritic, neuroprotective, antiantiand specification, but was obtained in electronic format the printed specification, but was obtained in electronic format directely from WIPO at ftp.wipo.int/published pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             69
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     48
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to novel antibodies that immunospecifically bind
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Single chain antibody that immunospecifically binds BLyS SeqID 1321.
                                                                          antibody; B lymphocyte stimulator; BLyS; tumour necrosis factor; B cell proliferation; differentiation; scFv; myasthenia gravis; multiple sclerosis; asthma; rheumatoid arthritis; AIDS; leukaemia; carcinoma; lymphoma; antirheumatic; antiarthritic; neuroprotective; antiinflammatory; antiasthmatic; antiallergic; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GAAATCAATCATAGTGGAAGCACCAACTACAACCCGTCCCTCAAGAGT-

BLyS is a member of the tumour necrosis factor (TNP) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antitheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 13q34 and encodes a protein that is a member of the tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antibody; B lymphocyte stimulator; BLyS; tumour necrosis factor; B cell proliferation; differentiation; scFv; myasthenia gravis; multiple sclerosis; asthma; rheumatoid arthritis; AIDS; leukaemia; carcinoma; lymphoma; antirheumatic; antiarthritic; neuroprotective; antiinflammatory; antiasthmatic; antiallergic; cytostatic.

proliferation and differentiation. Specifically, it refers to single chain antibody molecules (GFCFWs) derived, preferably, from the variable hartibody molecules (GFCFWs) derived, preferably, from the variable havy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The fresher invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as AIDS and proliferative disorders including leukaemia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various activities such as antirheumatic, antiallergic and cytostatic. This antinflammatory, antiasthmatic, antiallergic and cytostatic. This colypeptide sequence is a single chain antibody that binds BLyS of the invention. NOTE: The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directely from WIPO at ftp.wipo.int/published pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antiAIDS; vaccine; cancer; immune; autoimmune disorder; immunodeficiency; systemic lupus erythematosus; rheumatoid arthritis; CVID; AIDS; common variable immunodeficiency; acquired immunodeficiency syndrome.

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell cytostatic, immunosuppressive, immunostimulant, immunomodulatory, or orbiteration and differentiation. The antibodies D cell invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antitheumatic and antiALDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency and fragments of the antibodies described in the method of
                                                                           Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                B cell proliferation, differentiation; scrv; myasthenia gravis; untitiple sclerosis; asthma; rheumatoid arthritis; ADS; leukaemia; carcinoma; lymphoma; antirheumatic; antiarthritic; neuroprotective; antiinflammatory; antiarthmatic; antiallergic; cytostatic

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to C chromosome 1343 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single contain antibody molecules (ecfvs) derived, preferably, from the variable contain antibody molecules (ecfvs) derived, preferably, from the variable contains region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The person invention refers to the use of such antibodies in various methods contains to inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as AIDS and proliferative disorders including leukaemia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various cutivities such as antirheumatic, antialerspic and cytostatic. This collymphoma to a proliferative disorders including leukaemia, carcinoma and cutivities such as antirheumatic, antialerspic and cytostatic. This polypeptide sequence is a single chain antibody that binds BLyS of the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format of the printed specification, but was obtained in electronic format.
                                                                                                                                                                                                                                                                                                                                                                                                                                      stimulator
                                                                                                                                                                                                                                                                                                                                                                                                                Novel antibody that immunospecifically binds to a B lymphocyte stimu (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.
                                                                                                                                                                                                                Hilbert D;

```
AAW62793-822 represent fragments of human antibodies produced by transgenic Xenomice, created using the method of the invention. The specification describes a transgenic non-human mammal which has genome modifications that comprise an inactivated endogenous immunoglobulin [Ig] locus, so that the mammal does not display normal B-cell development. The modified genome also has an inserted human heavy chain Ig locus in germline configuration, the human heavy chain Ig locus comprising a human micro constant region and regulatory and switch sequences, human J-H genes, and human V-H genes and an inserted human kappa light chain Ig locus in germline configuration, the human J-H genes, and human N-H genes and an inserted human kappa light chain Ig locus comprising a human Kappa constant region, J-kappa genes, and human B-cell development in the human Light chain Ig locus in germline configuration, the human I The chain Ig locus including both a selected to restore normal B-cell development in the mammal. The transgenic animals have a near complete human Ig locus, including both a human heavy chain locus and a human kappa light chain locus. They can be used for the production of human antibodies when exposed to particular antigens e.g. when exposed to human ll-8, EGFR or TNF- alpha the mice will produce antibodies to IL-8, EGFR or TNF- alpha respectively
                                                                                                                                                                                                                                                                                                                                                                    New transgenic non-human mammals - having an inactivated immunoglobulin
locus and a near complete human immunoglobulin locus, used for production
                                                                                                                                                                                                                                                                              Green L;

from DNA of dominant clone 4d76 of B-cells taken from the cerebrospinal fluid (CSF) of a multiple sclerosis (MS) patient. Sequences of VH of CSF becalls were obtained from 4 MS patients (see AAX5316-19). Differences in nucleotide and predicted amino acid (see AAX05591-94) sequences were compared with the closest known germline VH genes; for 4d76, this was RA. The results provided direct evidence that intrathecal clonally expanded eclls from the CSF of MS patients are hypermutated postgerminal centre antibody-forming or memory lymphocytes that havd undergone antigen selection. This finding implicates an important pathogenic pathway for

```
The invention relates to a peptide or polypeptide comprising an Fv molecule, a construct or fragments or a construct of a fragment with enhanced binding characteristics which selectively and/or specifically binds to a target cell in favour of other cells, where binding is primarily determined by a first hypervariable region and Fv is a single chain Fv (scFv) or a disulfide Fv (dsFv). The peptide, optionally in association with or attached, compled, combined, linked or fused to a pharmaceutical agent, is useful in the manufacture of a medicament, where

the development of demyelination in CNS of MS. The invention provides assay kits for determining B-cell or T-cell clonality. This technology allows the establishment of clonal specific RNA library from pathogenic cells in the CNS of patients, which is important for further understanding of the role of antigen(s) in the cause of B-cell clonal expansion, and towards developing antigen specific therapeutic strategy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Levanon A;

the medicament has activity against a diseased cell, preferably a cancer cell (selected from carcinoma, sarcoma, leukaemia, adenoma, lymboma, myeloma, blastoma, seminoma, and melanoma, where the leukaemia cell is an acute myeloid leukaemia cell). The peptide is also useful for preparing a composition for use in inibiting the growth of a diseased or cancer cell. This sequence represents a human Fv molecule hypervariable region related peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complex comprising at least one

determining critically important amino acid residues in the framework, and without the need for multiple iteration and construction to obtain humanised antibodies with suitable therapeutic properties. The antibody has high affinity and low immunogenicity without need for comparing framework sequences between non-human and human antibodies. This sequence represents a human heavy chain variable region gene segment used in the
                              comprising making chimeric antibodies containing a complementarity determining region (CDR) from a non-human antibody and appropriate framework sequences (I) of human antibodies. (I) is selected by using canonical CDR structure types of non-human antibody in comparison to germline canonical CDR structure types of human antibody in comparison to for selection, for humanisation. The method is useful for making a humanised antibody or a converted antibody. The method is applicable for converting a subject antibody sequence of any subject species to a less immunogenic form suitable for use in an object species. The method is reliable for identifying suitable human framework sequences to support non-human CDR regions and to provide humanised antibodies that retain high antigen binding with low immunogenicity in humans, without the need for direct comparison of framework sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antibody library; CD1 region; CD2 region; VH region; VL region; immunoglobulin; CD3 region; TM1 scFv; human.
                  The invention describes a method of making a humanised antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human protein relating to the invention SEQ ID NO:55.
                                                                                                                                                                                                                                                                                                                                                                                                                                     97

Highly stable artificial antibody libraries with super-repertory and

```
Classifying a B-cell as malignant or normal by isolating a sequence representing an Ig variable region from the B cell, detecting the presence of a glycosylation site and classifying the cell as malignant or
                                                                       The invention relates to a novel artificial single-stranded antibody library with superior-repertory. The library is created by using a cDNA library as template for amplifying a fragment containing the CDI and CD2 regions of the VH or VL region of immunoglobulin gene and a fragment containing the CD3 region by PCR, respectively, producing VH and VL libraries, transferring into a host, and displaying the single-stranded antibody on a phage surface. An antibody library of the invention is useful as a tool in proteomics and antibody chips and filters, for screening ligands for antigens, and for studying protein-DNA interaction, diagnosis and treating various diseases. The present sequence represents a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  68

                                       malignant or normal comprising: (a) isolating a sequence representing an immunoglobulin (ig) variable region from the B cell; (b) detecting the region from the B cell; (b) detecting the region from the B cell; (b) detecting the cell as malignant or normal on the basis of the presence or absence of a glycosylation site, and (c) classifying the cell as a glycosylation of the Ig variable region of the B cell receptor and (l) screening for substances capable of inhibiting glycosylation of the Ig variable region of the B cell receptor; and (3) screening for substances (S) capable of inhibiting the interaction between lectins of the type found in the germinal centre and N-glycans found on the surface of Ig of lymphoma cells. (S) has cytostatic activity, and can be used in gene therapy, and as a glycosylation inhibitor. The method is useful in classifying a B-cell as malignant or normal. The glycosylation inhibitor is useful in preparing a medicament for treating non-Hodgkin's lymphoma. The present sequence represents an Ig variable region sequence which is used in the cycemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                               1 GAAATCAATCATAGTGGAAGCACCAACTACAACCCGTCCCTCAAGAGTCGGGCGAGTCAG 60

The present invention relates to a method for optimizing at least one physico-chemical property of an antibody by a computational screening method. The method comprises: receiving a template antibody structure; selecting at least one variable position belonging to the antibody structure; selecting at least one amino acid to be considered at the variable position(8); analyzing the interaction of each selected amino acid at each variable position with at least part of the remainder of the antibody, including the selected amino acids at other variable positions; and identifying a set of at least one antibody sequence with at least optimized physico-chemical property. The method is useful for optimizing the physico-chemical properties of an antibody, especially the stability, solubility, or antigen blinding affinity. The optimized antibody may be useful for treating a patient. The present sequence is an antibody may be variable region sequence used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       68

```
The present invention relates to a method for optimizing at least one physico-chemical property of an antibody by a computational screening method. The method comprises: receiving a template antibody structure; selecting at least one variable position belonging to the antibody structure; selecting at least one amino acid to be considered at the variable position(s); analyzing the interaction of each selected antibody acid at each variable position with at least part of the remainder of the antibody, including the selected amino acids at other variable positions; and identifying a set of at least one antibody sequence with at least one optimized physico-chemical properties of an antibody especially the stability, the physico-chemical properties of an antibody especially the stability, useful for treating a patient. The present sequence is an antibody may be useful for treating a patient. The present sequence is an antibody wariable region sequence used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 97 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Alignment Scores:

Exemplocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell tumour necrosis factor (TNF) super family and induces B cell tumour necrosis factor (TNF) super family and induces B cell tumour and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antitheumatic and antiAIDS activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant ENS expression and activity of autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency (GVID) and the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                         This invention describes novel antibodies that immunospecifically bind to

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to Ciromosome 1943 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scrws) derived, preferably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The resent invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as AIDS and proliferative disorders including leukaemia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various activities such as antirheumatic, antiallergic and cytostatic. This antiinflammatory, antiasthmatic, antiallergic and cytostatic. This antiinflammatory, antiasthmatic, antiallergic and cytostatic. This circumic format of nor form part of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                        Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ---GluTrpIleGlyGluIleAsnHisSerGlySerThrAsnTyrAsnProSerLeuLy 64

The present invention describes a protein comprising an immunoglobulin (Ig) heavy chain variable (VH) domain and an Ig light chain variable (VL) addomain. The protein binds a complex comprising a major histocompatibility complex (MHC) and a peptide, does not substantially bind the MHC in the absence of the bound peptide, and does not substantially bind the peptide comprising the novel protein and a carrier; (2) a cytotoxic T cell comprising one or more nucleic acids for expressing the Ig that binds a comprising one or more nucleic acids for expressing the Ig that binds a comprising one or more nucleic acids for expressing the Ig that binds a comprising one or more nucleic acids for expressing the Ig that bind the UC comprising an MHC and a peptide, and does not substantially bind the MHC in the absence of the MHC; (3) an isolated nucleic acid acid sequences that encodes the comprising a first segment that encodes the Ig variable domain; (4) a comprising a first segment that encodes the protein; (5) a transgenic animal whose genome includes heterologus concern; (5) a transgenic animal whose genome includes heterologus concern that specifically binds the MHC-peptide complex; (7) expressing a cancerous disorder in a subject; and (10) detecting an MHC-peptide complex in a sample. A protein of the invention has cytostatic activity, and composition for treating or preventing a composition for peptide complex in a supject of an antibody which binds to an MHC-peptide complex in the peptide component in as peptide on a peptide component of peptide complex where the peptide component in a supject of an antibody which binds to an MHC-peptide complex where the peptide component in a supject of an antibody which binds to an MHC-peptide complex where the peptide component in a supject of an antibody where the peptide or an

New transgenic non-human mammals - having an inactivated immunoglobulin locus and a near complete human immunoglobulin locus, used for production of human antibodies.

Disclosure; Page 71; 128pp; English.

transgenic Xenomice, created using the method of the invention. The profitation describes a transgenic non-human mammal which has genome specification describes a transgenic non-human mammal which has genome modifications that comprise an inactivated endogenous immunoglobulin (Ig) locus, so that the mammal does not display normal B-cell development. The modified genome also has an inserted human heavy chain Ig locus in germline configuration, the human heavy chain Ig locus in micro constant region and regulatory and switch sequences, human J-H genes, and human V-H genes and an inserted human kappa light chain Ig locus in germline configuration, the human J-H genes, where the number of V-H and v-kappa genes, inserted are selected to restore normal B-cell development in the mammal. The selected to restore normal B-cell development in the mammal. The call cours channed have a near complete human Ig locus, including both a human heavy chain locus and a human kappa light chain locus. They can be used for the production of human antibodies when exposed to particular antigens e.g. when exposed to human IL-B, EGFR or TNF- alpha the mice will produce antibodies to IL-B, EGFR or TNF- alpha respectively

This sequence represents a heavy chain variable region (VH) as predicted from DNA of dominant clone 4d76 of B-cells taken from the cerebrospinal from DNA of a multiple sclerosis (MS) patient. Sequences of VH of CSF B-cells were obtained from 4 MS patients (see AAX25316-19). Differences in nucleotide and predicted amino acid (see AAX05691-94) sequences were compared with the closest known germline VH genes; for 4d76, this was RA. The results provided direct evidence that intrathecal clonally expanded B-cells from the CSF of MS patients are hypermutated postgerminal centre antibody-forming or memory lymphocytes that havd undergone antigen antibody-forming or memory lymphocytes that havd undergone antigen the development of demyelination in CNS of MS. The invention provides assay kits for determining B-cell or T-cell clonality. This technology allows the establishment of clonal specific RNA library from pathogenic cells in the CNS of patients, which is important for further understanding of the role of antigen(s) in the cause of B-cell clonal expansion, and towards developing antigen specific therapeutic strategy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; Fv molecule; hypervariable region; single chain Fv; cytostatic; disulfide Fv; dsFv; scFv; cancer; carcinoma; sarcoma; leukaemia; adenoma; lymphoma; myeloma; blastoma; seminoma; melanoma; acute myeloid leukaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δ
                                                                                                                                                                                                         The invention relates to a peptide or polypeptide comprising an Fv molecule, a construct or fragments or a construct of a fragment with enhanced binding characteristics which selectively and/or specifically binds to a target cell in favour of other cells, where binding is primarily determined by a first hypervariable region and Fv is a single chain Fv (8cFv) or a disulfide Fv (46Fv). The peptide, optionally in association with or attached, coupled, combined, linked or fused to a pharmaceutical agent, is useful in the manufacture of a medicament, where the medicament has activity against a diseased cell, preferably a cancer the medicament because and melanoma, leukaemia, adenoma, lymphoma, myeloma, blastoma, seminoma, and melanoma, where the leukaemia cell is an cutte myeloid leukaemia cell). The peptide is also useful for preparing a composition for use in inhibiting the growth of a diseased or cancer cell. It is the septements a human Fv molecule hypervariable region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    42 GlyLys----GlyLeu----GluTrp11eGlyGluIleAsnHisSerGlySerThrAsnT 59

infortant in physiological phenomena such as cell rolling, metastasis and inflammation, where the epitope is capable of being bound by an antibody, inflammation, where the epitope is capable of being bound by an antibody, crit antigon-binding fragment or its complex comprising at least one antibody or its binding fragment having a first hypervariable region. The epitopes are useful for inhibiting cell rolling, inflammation, autoimmune cell-tendrosis, restenosis, metastasis, growth and/or replication of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells in a patient, cell-rell-matrix, platelet-matrix, platelet- platelet adhesion or aggregation, for increasing continuity of tumour or leukaemia cells for increasing the susceptibility of diseased cells to damage by anti-disease, anti-cancer or anti-cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for diagnosing and treating diseases canchase cancer, leukaemia, autoimmune diseases, inflammatory contineases such as myocardial infarction, retinopathic diseases such as myocardial infarction, retinopathic diseases and other diseases mediated by abnormal platelet function and diseases and other diseases wediated by abnormal platelet function and diseases caused by sulphated tyrosine-dependent protein-cells interactions. This sequence represents a human antibody fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated epitope present on cancer cells and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mar-Haim H;

                                                                                                                                                                                                                                                                                                                      comptising making chimerical antibodies contraining a complementarity determining region (CDR) from a non-human antibody and appropriate framework sequences (I) of human antibodies. (I) is selected by using canonical CDR structure types of non-human antibody in comparison to germline canonical CDR structure types of human antibody in comparison to germline canonical CDR structure types of human antibody so the basis for selection, for humanised antibody or a converted antibody. The method is applicable for converting a subject antibody sequence of any subject species. The method is reliable for identifying suitable humanised antibodies that retain him antigen binding with low immunogenicity in humans, without the need for on-human CDR regions and to provide humanised antibodies that retain high antigen binding with low immunogenicity in humans, without the need for determining critically important amino acid residues in the framework sequences of humanised antibodies with suitable therapeutic properties. The antibody framework sequences between non-human and human antibodies. This sequence represents a human hashy chain variable region gene segment used in the

The invention relates to a novel artificial single-stranded antibody library with superior-repertory. The library is created by using a CDNA library as template for amplifying a fragment containing the CD1 and CD2 regions of the VH or VL region of immunoglobulin gene and a fragment containing the CD3 region by PCR, respectively, producing VH and VL Inbraries, transferring into a host, and displaying the single-stranded antibody on a phage surface. An antibody library of the invention is useful as a tool in proteomics and antibody chips and filters, for screening ligands for antigens, and for studying protein-DNA interaction, diagnosis and treating various diseases. The present sequence represents a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Highly stable artificial antibody libraries with super-repertory and little contamination from unexpressible ones, useful as tool in proteomics and e.g. for diagnosis and treating various diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               B-cell; malignant; immunoglobulin; immunoglobulin variable region;
                                                                                        antibody library, CD1 region; CD2 region; VH region; VL region; immunoglobulin; CD3 region; TM1 scFv; human.
                                              Human protein relating to the invention SEQ ID NO:55
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   97

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 à
                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method for classifying a B-cell as malignant or normal comprising: (a) isolating a sequence representing an immunoglobulin (Ig) variable region from the B cell; (b) detecting the presence of a glycosylation site; and (c) classifying the cell as malignant or normal on the basis of the presence or absence of a glycosylation site. Also described: (l) treating a patient suffering from or at risk of having lymphoma; (2) screening for substances capable of inhibiting glycosylation of the Ig variable region of the B cell receptor; and (3) screening for substances (5) capable of inhibiting the cinteraction between lectins of the type found in the germinal centre and N-glycans found on the surface of Ig of lymphoma cells. (5) has cytostatic activity, and can be used in gene therapy, and as a glycosylation inhibitor. The method is useful in classifying a B-cell as malignant or normal. The glycosylation inhibitor is useful in preparing a medicament for treating non-Hodgkin's lymphoma. The present sequence ceresents an Ig variable region sequence which is used in the cycentation of the present invention.
                                                                                                                                                                                                                                                                    Classifying a B-cell as malignant or normal by isolating a sequence representing an Ig variable region from the B cell, detecting the presence of a glycosylation site and classifying the cell as malignant or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ig variable region; glycosylation site; lymphoma; B cell receptor; cytostatic; gene therapy; glycosylation inhibitor; non-Hodgkin's lymphoma..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        97

antibodies variable

Marshall SA, Dahiyat B;

```
The present invention relates to a method for optimizing at least one physico-chemical property of an antibody by a computational screening method. The method comprises: receiving a template antibody structure; selecting at least one variable position belonging to the antibody structure; selecting at least one amino acid to be considered at the variable position(s); analyzing the interaction of each selected amino acid at each variable position with at least part of the remainder of the antibody, including the selected amino acids at other variable positions; and identifying a set of at least one antibody sequence with at least optimized physico-chemical property. The method is useful for optimizing the physico-chemical property. The method is useful for optimizing solubility, or antigen binding affinity. The optimized antibody may be useful for treating a patient. The present sequence is an antibody way be variable region sequence used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   59
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              97

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                    The present invention relates to a method for optimizing at least one physico-chemical property of an antibody by a computational screening method. The method comprises: receiving a template antibody structure; selecting at least one variable position belonging to the antibody structure; selecting at least one amino acid to be considered at the variable position(s); analyzing the interaction of each selected amino acid at each variable position with at least part of the remainder of the antibody, including the selected amino acids at other variable positions; and identifying a set of at least one antibody sequence with at least one optimized physico-chemical properties of an antibody sepecially the stability, solubility, or antigen binding affinity. The optimized antibody may be useful for treating a patient. The present sequence is an antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Computer optimization of physicochemical properties of antibodies comprises analyzing the interactions of amino acids at variable
          Antibody; stability; solubility; antigen binding affinity; variable region; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antibody; stability; solubility; antigen binding affinity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                    variable region sequence used to illustrate the invention
